Configure Server as DHCP Server

Services → HTTP and HTTPS should be ON

Click on PC0 → Desktop → Web Server → Server address.

Server → DNS → DNS ON → Under name, give website address → under address ip address of Server.

Purpose of DNS → Mapping domain name with Server IP address.

- Go to PC0 Web Server → give IP address, we will be able to config as DNS Server as well as a web Server.
- All domain names must have unique IP address
- But it is difficult to remember IP address and hence we have a name which makes it easy to browse that web page on browser.
- All domain name is mapped in the back with unique IP address.

Learned how to Configure DNS Service from web.
